

## AMENDMENTS TO THE SPECIFICATION

Please amend the specification as indicated below without prejudice or disclaimer.

*Please amend lines 12-16 on page 2 as shown below:*

- 5   **Figure 1.** BFA4 cDNA sequence (SEQ ID NO.:1).
- Figure 2.** BFA4 amino acid sequence (SEQ ID NO.:2).
- Figure 3.** BCY1 nucleotide (A; SEQ ID NO.:3) and amino acid (B; SEQ ID NO.:4) sequences.
- Figure 4.** BFA5 cDNA sequence (SEQ ID NO.:5).
- Figure 5.** BFA5 amino acid sequence (SEQ ID NO.:6).

10

*Please amend the paragraph at page 14, lines 14-18 as shown below:*

A fusion motif may enhance transport of an immunogenic target to an MHC processing compartment, such as the endoplasmic reticulum. These sequences, referred to as transduction or transcytosis sequences, include sequences derived from HIV tat (see Kim et al. 1997 J. Immunol. 159:1666), *Drosophila* antennapedia (see Schutze-Redelmeier et al. 1996 J. Immunol. 157:650), or human period-1 protein (hPER1; in particular, SRRHHCRSKAKRSRHH (SEQ ID NO: 105)).

*Please amend Table III found on pages 30-31 as shown below:*

TABLE III

*BFA5 Peptide Pools*

*Please amend the paragraph on page 32, lines 16-32 as shown below:*

In addition to ELISPOT analysis, human T cells activated by BFA5 peptides were assayed to determine their ability to function as CTL. The cells were activated using peptide-pulsed dendritic cells followed by CD40 ligand-activated B cells (5 rounds of stimulation). The experiment shown was performed with isolated PBMC from HLA-A\*0201<sup>+</sup> donor AP31. Isolated T cells were tested in <sup>51</sup>Cr-release assays using peptide-loaded T2 cells. The % specific lysis at a 10:1, 5:1, and 1:1 T-cell to target ratio is shown for T2 cells pulsed with either pools of BFA5/NYBR-1 peptides or with individual peptides. The graph shows CTL activity induced against targets loaded with a c non-specific HLA-A\*0201-binding HIV peptide (control) followed by the CTL activity against the peptide pool (Pool 1 etc.) and then the activity induced by individual peptides from the respective pool to the right. A high level of cytotoxicity was observed for some peptides at a 1:1 E:T ratio. CTL activity (percent specific lysis) induced by the control HIV peptide was generally <10%. Similar results were obtained with another PBMC donor expressing HLA-A\*0201 (AP10). A large number of BFA5 peptides trigger T cell-mediated cytotoxicity of BFA5 peptide-loaded target cells. **Table IV** lists those peptides having immunogenic properties. Five peptides (LMDMQTFKA (SEQ ID NO.:7), ILIDSGADI (SEQ ID NO.:29), ILSVVAKLL (SEQ ID NO.:34), SQYSGQLKV (SEQ ID NO.:38), and ELCSVRLTL (SEQ ID NO.:70)) were found to induce both IFN- $\gamma$  secretion and CTL activity in T cells from both donors.

Please amend Table IV beginning on page 32, line 33 as shown below:

**TABLE IV**  
Immunoreactive peptides from BFA5

	BFA5 peptides eliciting high IFN- $\gamma$ release (>200 spots/100,000 cells)		BFA5 peptides inducing CTL lysis of pulsed cells

*Please amend line 26 on page 34 as shown below:*

To assess the quality of the polyclonal antisera, western blots were performed using sera against BFA5. Sera were separately screened against cell extracts obtained from the BT474, MDMB453, MCF-7, Calu-6, and CosA2 cells. The approximate expected MW<sub>r</sub> of BFA5 protein is 153 kDa. A 220 kDa band was observed in the BT474 extract with CLP2980 antibody but not in the MDMB453 cell extracts however a ~130kD band was present in the MDMB453 extract. Both bands were found to be consistent with the polyclonal antibodies tested in this analysis. Neither of these bands is present in the negative control. Thus, it can be concluded that the polyclonal antisera are specific for BFA5.
